React (JS)	React Tutorial	show to set up react project using node
React (JS)	Recent - CodeSandbox	show different examples of apps within React through the web no installs needed
Flutter	Flutter documentation	has links to video tutorials and different learning resources
React (JS) & Flutter	https://chatgpt.com/	showed me examples of different framewoks that I may be interested in
React(JS)	React	React website shows quickstarts and example code for apps
React(JS)	YouTube	Different videos on how to set up apps. Did not save the video links mistake

This is to use React.js on visual studio through vite. * = a space in text.
npm.cmd create vite@latest * ProjectName
then do cd ProjectName to change to it

to try and get local host do this in terminal first press cntrl c to stop processing then in terminal type " npm.cmd run dev " and it show the local host.
every time i want to run my app save it by pressing cntrl s in order to get the latest version of code
Ran into an Error with a npm file because powershell was blocking it. Had to type npm.cmd --version
Ran into a problem when trying to run the app was trying to run off node using play button but would throw errors
This was the fix to run project in order to get url npm.cmd run dev
Function App(){}
^this is to create react component
export default App;
^this is to allow the app component to be used in other files
Import './___.css'
^this is to connect the .css file to react app
Ran into problem with App1 cannot remember what it was but it would not run I ended up copy pasting my code into codex sandbox and worked just fine so i deleted the folder within visual studio and made a new app1 folder which seemed to fix it
onClick={___}
^this goes inside<button> it is used to run a function when button is clicked
.classname within .css file is for calling the class into .css
I called a class inside of app.css but did not make a class in app.js so it did not let me edit or customize the look of my button
to fix this i had to do
    <button className="Hello" onClick={Click}>
^this would also let me center my button as I could not figurecit out. But fixed by making a app class and editing that within the the .css file
Also ran into a problem with my button not doing anything when pressed this was because I did not match the class name inside the .jsx or .css file
I had errors with my spelling and also with capitalizing letters so my code would not run tried to run on a different website and did the same went through code multiple times after a while was able to find and fix
In my app 2 i ran into problems with not being able to type at all and my add/remove buttons not working this was fixed by capitalizing the C on onChange={(e) => setOption(e.target.value)} and also on setChoices I had misspelled choices as chooices
my inputs would not line up had to fix within the .css file
had a separate outine box so i matched it to the color if the background as a simple fix to get rid of it
